Inspection and Maintenance for Eye Protection

- Keep eye protection clean — continuous use of dirty lenses can cause eyestrain.
- Replace pitted and/or deep scratched lenses because they reduce vision and have a greater potential to break.
- Conduct daily inspection of eye protection.
- Eye protection disinfecting involves thoroughly cleaning all parts with soap and warm water.
- Rinse all traces of soap off and replace any defective parts.
- When a germicidal solution is used, soak all parts of the eye protection for 10 minutes.
- Do not rinse after removing; this will remove the germicidal residues which are effective after drying. Permit the eye protection to air dry.
